

## ELECTRONEGATIVITY

Electronegativity is a parameter originally introduced by Pauling which describes, on a relative basis, the tendency of an atom in a molecule to attract bonding electrons. While electronegativity is not a precisely defined molecular property, the electronegativity difference between two atoms provides a useful measure of the polarity and ionic character of the bond between them. This table gives the electronegativity  $X$ , on the Pauling scale, for the most common oxidation state. Other scales are described in the references.

<b>Z</b>	<b>Symbol</b>	<b>X</b>	<b>Z</b>	<b>Symbol</b>	<b>X</b>	<b>Z</b>	<b>Symbol</b>	<b>X</b>
1	H	2.20	33	As	2.18	65	Tb	—
