

## INDEX OF REFRACTION OF AIR

This is a table of the index of refraction  $n$  of dry air at 15°C and a pressure of 101.325 kPa and containing 0.045% by volume of carbon dioxide (“standard air”). The index of refraction is defined by  $n = \lambda_{\text{vac}} / \lambda_{\text{air}}$  where  $\lambda$  is the wavelength of the radiation. The index is calculated from the expression

$$(n-1) \times 10^8 = 8342.54 + 2406147(130 - \sigma^2)^{-1} + 15998(38.9 - \sigma^2)^{-1}$$

where  $\sigma = 1/\lambda_{\text{vac}}$  and  $\lambda_{\text{vac}}$  has units of  $\mu\text{m}$ . The equation is valid for  $\lambda_{\text{vac}}$  from 200 nm to 2  $\mu\text{m}$ . The table also gives the correction  $(n-1)\lambda_{\text{air}}$  which must be added to the wavelength in air to obtain  $\lambda_{\text{vac}}$ .

If the air is at a temperature  $t$  in °C (ITS-90) and a pressure  $p$  in pascals, a value of  $(n - 1)$  from this table should be multiplied by

$$p[1 + p(60.1 - 0.972t) \times 10^{-10}]/96095.43(1 + 0.003661t)$$
